1 Overall Packet Structure

The structure of the packet (and the data sub-packet) relies on byte positions and known values, rather than delimiters.

Field	Value	Byte Position	Length
Start	0xAA	0	1
Protocol version	0x00	1	1
Length of data (not whole packet)		2	1
Data		3	194
CRC of data (not whole packet)		197	1
End	0x55	198	1

Table 1: Overall packet structure

Important: If the *length of data* is 0, the packet immediately ends, meaning the *data, CRC,* and *end* fields do not exist.

2 Data Sub-Packet

The data sub-packet consists of 32 "chunks" (30 sensors and 2 MAC addresses). Each "chunk" follows one of seven formats.

2.1 Data Formats

Format	Byte 0	Byte 1	Byte 2	Byte 3	Byte 4	Byte 5
1	(1 « 7) | 7-bit int	(neg « 7) | 7-bit frac.	-	-	-	-
2	7 MSb	LSB	-	-	-	-
3	Addr5	Addr4	Addr3	Addr2	Addr1	Addr0
4	(1 « 7) | (neg « 6) | (4-bit int « 2) | 2 MSb of frac.	8 LSb of frac.	-	-	-	-
5	(neg « 6) | 6 MSb	8 LSb	-	-	-	-
6	(1 « 7) | (neg « 6) | 6 MSb	Middle 8 bits	8 LSb	-	-	-
7	First 8 "chunks"	8 "chunks"	8 "chunks"	Last 8 "chunks"	-	-

Table 2: Data formats

This version of the Waggle protocol does not use standard representations for floating point numbers. Instead, the location of the decimal point is pre-determined (between the integer and fractional components, if applicable).

The most significant bit in byte 0 of formats 1, 4, and 6 means the data is already converted. Formats 2 and 5 contain raw data.

Formats 1, 4, 5, and 6 contain a "negative" bit. If this bit is 1, the value is negative.

2.2 Data "Chunks"

The *length* in each data "chunk" represents the number of bytes of sensor data. The total "chunk" length is *length* + 2.

4 Example

In the example below, the spaces and brackets are used to clearly show the different fields within the packet. The actual packet, or any component of it, does not have spaces or brackets. This example is in hex format.
